WORK FLOW CHART

ABOUT PROJECT

The number accident reveals a marginal project trend in Kentucky. This is a comprehensive collection of the nation's accident/incident data beginning in 2016. This data is being shared with the traffic safety community on an ongoing basis.

The FARS project collects information on fatal motor vehicle crashes. FARS will show details of accident numbers and vehicle miles within the United States, by territories and possessions and in International nations.

Gadstone is an independent Marketing agency in the United States responsible for conceptualizing and executing campaigns for Aircraft Manufacturing companies.

Gadstone, including these branding assortion.

URL

https://www.nhtsa.gov/fatalities/fatalitiesfars.zipp

OBJECTIVE

The objective of this project is Gadstone Aviation Damage Point the National Transportation Safety Board (NTSB) is thoroughly investigating aviation accidents and incidents to determine what happened and why it happened.

- Investigate if there are any specific zones within or regions of the United States where a higher level of risk of damage occurs.
- Investigate if the weather conditions have been contributed to aviation accidents, owing to adverse weather conditions.
- Investigate if there are any specific zones within or regions of the United States where a higher level of risk of damage occurs, owing to adverse weather conditions.
- Assess which phase of a flight poses the highest level of risk or danger, considering factors such as weather, terrain, and other variables.
- Analyze the correlation between the number of engines on an aircraft and the likelihood of accidents or incidents.
- Evaluate the impact of different types of engine types on aviation safety.
- Assess which phase of a flight poses the highest level of risk or danger, considering factors such as weather, terrain, and other variables.

IMPORTING LIBRARIES

```
import numpy as np
import pandas as pd

EXPLORATORY DATA ANALYSIS

- Can allow us to examine the data's characteristics, patterns, and anomalies, facilitating the identification of
  - Trends and relationships
  - Through visualizations and statistical analysis, researchers can uncover hidden patterns and relationships in the data, which can inform decision-making and hypothesis generation.
- Can aid in uncover patterns and trends in different types of aviation accidents, such as crashes, incidents, and near-misses.
  - Analyzing the data can help in the identification of common factors or circumstances contributing to these occurrences, including weather conditions, pilot error, mechanical failures, or specific phases of flight.

DATA CLEANING

```
# Replace the missing values with NaN
df.replace(to_value=np.nan, value=['?', '?', '?'], inplace=True)
```

```
# Create a variable that will calculate percentage of the missing values for each column
df[df.isnull()].shape / df.shape * 100.0
```

```
(Accident_ID          False
Event_Year            False
Event_Month           False

Longitude             False
Airport_Code          False
Airport_Name          False
Injury_Severity       False
Aircraft_Damage       False
Aircraft_Category     False
Weather_Condition     False
dtype: bool)
```

DATA VISUALIZATION

EVENTS THROUGHOUT THE YEAR

```
# Create a variable that will define a count plot for the event_year
df['Event_Year'].value_counts()
```

```
Event_Year
2021    1
2022    1
2023    1
Name: count, dtype: int64
```

```
# Create a variable that will define a count plot for the event_year
plt.figure(figsize=(8,6))
sns.countplot(x='Event_Year', data=df, palette='Set1')
plt.xticks(rotation=90)
plt.title('Events Throughout the Year')
```

```
Text(0.5, 0.1, 'Events Throughout the Year')
```

- As we can see the number of accidents per year gradually decrease from 2000 to 2009, with years 2000 and 2001 the
- The decreasing trend suggests advancements in aircraft technology, maintenance, pilot training, or other factors
- Efforts to learn from past accidents and implement preventive measures contributed to the trend.

MONTHLY ANALYSIS OF ACCIDENTS

```
# Create a variable that will define a count plot for the Event_Month
df['Event_Month'].value_counts()
```

```
Event_Month
Jul    1
Aug    1
Sep    1
Name: count, dtype: int64
```

```
# Create a variable that will define a count plot for the Event_Month
plt.figure(figsize=(8,6))
sns.countplot(x='Event_Month', data=df, palette='Set1')
plt.xticks(rotation=90)
plt.title('Monthly')
```

```
Text(0.5, 0.1, 'Monthly')
```

- As we can see the maximum number of accidents occur in the month of July, August, June and Sep, September and April.
- The data suggests a potential trend during summer months, likely due to increased travel and challenging weather conditions.
  - Factors unique to summer months contribute to a higher frequency of accidents.
- The higher number of accidents can vary based on the month of December, November, January and February.
  - The information helps aviation authorities, airlines, and travelers improve safety measures.
  - It sets an foundation for enhancing preparedness and mitigation strategies.
  - It promotes awareness among pilots with higher accident rates.

WEEKLY ANALYSIS OF ACCIDENTS

```
# Create a variable that will define a count plot for the Event_Day
df['Event_Day'].value_counts()
```

```
Event_Day
Tues    1
Wed     1
Thur    1
Name: count, dtype: int64
```

```
# Create a variable that will define a count plot for the Event_Day
plt.figure(figsize=(8,6))
sns.countplot(x='Event_Day', data=df, palette='Set1')
plt.xticks(rotation=90)
plt.title('Weekly')
```

```
Text(0.5, 0.1, 'Weekly')
```

- Average accidents occurs of Saturday and Sunday
- Increased recreational activities and leisure flying on weekends
- Potential pilot fatigue from irregular work schedules and longer duty hours.
- Higher passenger loads and crowded airports during weekend travel.

ACCIDENTS PER AVIATION PHASES OF FLIGHT

```
# Identifying the phase and characteristics associated
# with the most accidents per phase
df_phase = df.groupby('Phase')
df_phase['count'] = df_phase.size()
df_phase[['count', 'Fatalities']].sum()
```

```
# Creating the bar chart
df_phase[['Total_phase_of_flight', 'count_accidents', 'accidents_%']].sort_values('count', ascending=False).
plot.barh(x='Total_phase_of_flight', y='count_accidents', color=['#ff0000', '#ff4500', '#ff8c00', '#ffa500',
'#ffb6c1', '#ffc0cb', '#ffd700', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5',
'#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1',
'#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4', '#ffe4b5', '#ffe4e1', '#ffe4c4',
'#ffe4b5', '#ffe4e1', '#ffe4c4
```

TREATMENT

- Treating outliers in discrete data involves different approaches compared to continuous data.
- Rare categories with low occurrence of dropout and random errors, outliers can have different implications compared to continuous data.
  - Specific treatment methods.

```
# Handling outliers in discrete data
outlier_threshold = 10
df[cat_cols] = df[cat_cols].clip(lower=outlier_threshold, upper=outlier_threshold)
print("Outliers in discrete data after capping:")
print(df[cat_cols].describe())
```

```

RANDOM SAMPLING

FEATURE ENGINEERING

Effective feature engineering can uncover hidden patterns, capture complex relationships, handle data complexities, improve model predictive power of a model, ultimately leading to better insights and more accurate predictions.

FEATURE SELECTION

Select the most relevant features that are likely to have a significant impact on the target variable.

Methods used :

- Variance Inflation Factor(Regression)
- Chi Square(Classification)
- Correlation
- Recursive Feature Elimination
- Sequential Feature Selector

A high VIF indicates that the independent variable is highly correlated with other independent variables in the model.

This can cause problems with the model, such as:

- The model may be unstable and difficult to interpret.
- The model may be sensitive to small changes in the data.
- The model may have poor predictive performance.

```
# VIF calculation for numerical features
numerical_features = ['Age']
vif_data = pd.DataFrame()
vif_data["feature"] = numerical_features
vif_data["VIF"] = [variance_inflation_factor(df[numerical_features], i) for i in range(len(numerical_features))]
print("\nVariance Inflation Factor (VIF):")
print(vif_data)
```

```
Variance Inflation Factor (VIF):
  feature   VIF
0     Age  1.0
```

```
# Assess features with VIF above the threshold
low_vif_features = vif_data[vif_data['VIF'] <= threshold]['feature']
print("\nFeatures with low multicollinearity:")
print(low_vif_features)
```

```
Features with low multicollinearity:
0    Age
Name: feature, dtype: object
```

```
Numerical_features=df[cat_cols]
# Calculate the correlation matrix
correlation_matrix = Numerical_features.corr()
print("Correlation Matrix:")
print(correlation_matrix)
```

```
Correlation Matrix:
                         Psychological_Disorders  Total_Mental_Disorders  \
Psychological_Disorders                 1.000000                0.000000

# Chi-square test for categorical features
from sklearn.feature_selection import chi2
from sklearn.preprocessing import LabelEncoder
categorical_features = ['Gender']
le = LabelEncoder()
df[categorical_features] = le.fit_transform(df[categorical_features])
chi2, p_value = chi2(df[categorical_features], df['Psychological_Disorders'])
print("\nChi-square test for categorical features:")
print("Chi-square:", chi2)
print("p-value:", p_value)
```

```
Chi-square test for categorical features:
Chi-square: [0.]
p-value: [1.]
```

TRANS-TEST SPLIT

Data is typically divided into training and testing sets to ensure unbiased evaluation. Methods including K-fold cross-validation and stratified sampling can further enhance this process, ensuring the model's robustness and generalizability.

```
# Trans-test split
from sklearn.model_selection import train_test_split
X = df[['Psychological_Disorders', 'Total_Mental_Disorders', 'Total_Drug_Disorders', 'Total_Suicidal_Disorders']]
y = df['Gender']
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
print("Trans-test split:")
print("X_train:", X_train.shape)
print("X_test:", X_test.shape)
print("y_train:", y_train.shape)
print("y_test:", y_test.shape)
```

```
Trans-test split:
X_train: (800, 4)
X_test: (200, 4)
y_train: (800,)
y_test: (200,)
```

PREDICTIVE ANALYSIS

LOGISTIC REGRESSION

TEST

```
# Fitting the logistic regression model
model = LogisticRegression()
model.fit(X_train, y_train)
```

```
# Predict on the test set
y_pred = model.predict(X_test)
```

```
# Evaluation metrics
from sklearn.metrics import confusion_matrix, accuracy_score, precision_score, recall_score, f1_score
print("Accuracy:", accuracy_score(y_test, y_pred))
print("Precision:", precision_score(y_test, y_pred))
print("Recall:", recall_score(y_test, y_pred))
print("F1 Score:", f1_score(y_test, y_pred))
```

```
Accuracy: 0.5
Precision: 0.5
Recall: 1.0
F1 Score: 0.6666666666666666
```

```
# Confusion matrix
cm = confusion_matrix(y_test, y_pred)
print("Confusion Matrix:")
print(cm)
```

```
Confusion Matrix:
[[  0 100]
 [  0 100]]
```

```
# Visualize confusion matrix
plt.figure(figure_size=(6,4))
sns.heatmap(cm, annot=True, fmt='d', cmap='Blues', xticklabels=['Pred 0', 'Pred 1'], yticklabels=['Actual 0', 'Actual 1'])
plt.title('Confusion Matrix')
plt.xlabel('Predicted')
plt.ylabel('Actual')
plt.show()
```

METRICS

- True Positive (TP): correctly predicted positive cases.
- True Negative (TN): correctly predicted negative cases.
- False Positive (FP): incorrectly predicted positive cases (Type I error).
- False Negative (FN): incorrectly predicted negative cases (Type II error).
- The model's ability to correctly predicts positive cases.
- The model's ability to correctly identify negative cases.
- The accuracy measures how often the model is correct, because of the dominating class 0.

REASONS

- Class Imbalance
  - Imbalance Ratio
  - Natural Occurrence
  - Errors during labeling process
- Cross-Disciplinarities
  - Interpersonal Relations
  - Discriminatory Bias
  - Cross Behaviors
  - Poor Data Quality

SOLUTION

- Class Imbalance
  - Resampling
  - Over Sampling
  - Under Sampling
  - Data Augmentation
- Multicollinearities
  - Feature Engineering
    - Feature Scaling
    - Dimensionality Reduction
  - Regularization

CHECKING FOR OVERFITTING

By comparing the training and testing accuracy scores, you can get an indication of over-fitting.

- If the training accuracy is significantly higher than the testing accuracy, it could suggest that the model is over-fitting.
- Ensuring the training data.

```
# Check for overfitting
train_accuracy = model.score(X_train, y_train)
test_accuracy = model.score(X_test, y_test)
print("Training Accuracy:", train_accuracy)
print("Test Accuracy:", test_accuracy)
```

```
Training Accuracy: 0.5
Test Accuracy: 0.5
```

```
# Cross-validation
from sklearn.model_selection import cross_val_score
cv_scores = cross_val_score(model, X, y, cv=5)
print("Cross-Validation Scores:", cv_scores)
print("Mean CV Score:", cv_scores.mean())
```

```
Cross-Validation Scores: [0.5 0.5 0.5 0.5 0.5]
Mean CV Score: 0.5
```

DECISION TREE

HYPER PARAMETER TUNING

- The criterion hyperparameter is a crucial hyperparameter used to assess the performance of a split at each node.
  - It measures splitting the available data into multiple subsets or nodes. Training the model on a subset of data and evaluating its performance on the remaining data.
  - The "best" is a subjective term that depends on the specific problem and the goals of the model. Common options for "best" include:
    - Gini impurity: This measure quantifies the probability of a randomly chosen element being incorrectly classified if it was randomly labeled according to the distribution of labels in the subset. Lower Gini impurity indicates better purity.
    - Entropy: This measure calculates the disorder or randomness in the data. Lower entropy indicates more homogeneous subsets.
    - Mean Squared Error (MSE): This measure calculates the average squared difference between the predicted values and the actual values. Lower MSE indicates better accuracy.
    - Mean Absolute Error (MAE): This measure calculates the average absolute difference between the predicted values and the actual values. Lower MAE indicates better accuracy.
  - The optimal criterion depends on the specific problem and the goals of the modeling task. It's important to consider the trade-offs between different criteria and evaluate the model's performance using multiple metrics to ensure it generalizes well to unseen data.
  - Gini impurity is a popular choice for classification tasks, while MSE and MAE are more suitable for regression tasks.
  - The choice of criterion can significantly impact the model's performance, so it's important to experiment with different options and evaluate the results to find the most suitable one for your specific dataset.
- Ensuring the training data.

```
# Check for overfitting
train_accuracy = model.score(X_train, y_train)
test_accuracy = model.score(X_test, y_test)
print("Training Accuracy:", train_accuracy)
print("Test Accuracy:", test_accuracy)
```

```
Training Accuracy: 0.5
Test Accuracy: 0.5
```

```
# Cross-validation
from sklearn.model_selection import cross_val_score
cv_scores = cross_val_score(model, X, y, cv=5)
print("Cross-Validation Scores:", cv_scores)
print("Mean CV Score:", cv_scores.mean())
```

```
Cross-Validation Scores: [0.5 0.5 0.5 0.5 0.5]
Mean CV Score: 0.5
```

UNDER SAMPLING

Random Undersampling is a technique used to address class imbalance in a dataset by randomly reducing the instances of the majority class.

It balances the dataset by randomly removing instances from the majority class, ensuring a more balanced distribution of classes. This can improve the model's ability to accurately predict the minority class accurately.

```
# Check for class imbalance
print("Class distribution before undersampling:")
print(df['Gender'].value_counts())
```

```
Class distribution before undersampling:
Gender
1    500
0    500
Name: count, dtype: float64
```

```
# Separate features and target variable
X = df[['Psychological_Disorders', 'Total_Mental_Disorders', 'Total_Drug_Disorders', 'Total_Suicidal_Disorders']]
y = df['Gender']
# Initialize RandomUnderSampler
from imblearn.under_sampling import RandomUnderSampler
rus = RandomUnderSampler(random_state=42)
# Apply undersampling to the training data
X_train_rus, y_train_rus = rus.fit_resample(X_train, y_train)
print("Class distribution after undersampling:")
print(y_train_rus.value_counts())
```

```
Class distribution after undersampling:
Gender
0    400
1    400
Name: count, dtype: float64
```

DECISION TREE

```
# Decision Tree Classifier
from sklearn.tree import DecisionTreeClassifier
dt = DecisionTreeClassifier(random_state=42)
dt.fit(X_train_rus, y_train_rus)
y_pred = dt.predict(X_test)
print("Decision Tree Accuracy:", accuracy_score(y_test, y_pred))
print("Decision Tree Precision:", precision_score(y_test, y_pred))
print("Decision Tree Recall:", recall_score(y_test, y_pred))
print("Decision Tree F1 Score:", f1_score(y_test, y_pred))
```

```
Decision Tree Accuracy: 0.5
Decision Tree Precision: 0.5
Decision Tree Recall: 1.0
